

Business Benefits

- Removes the burden of complex, daily backup chore
- Securely stores data off-site in Iron Mountain's underground mirrored data centers
- Rapidly restores data to any server, any location (DeltaRestore™)
- Delivers point-in-time recovery by continuous backup
- On-site appliance holds several weeks of data locally (TurboRestore™)
- Proactive and fully automated
- Predictable pricing

LiveVault® Server Backup and Recovery

Looking to liberate your IT staff from the burden of daily data management? CenterBeam offers a secure data storage solution, so your team can focus on projects that add value to your business.

Reliable backup and recovery are critical to today's information-driven business. Combining proven disk and online technologies, Iron Mountain's LiveVault® radically simplifies the protection of all your company's servers. LiveVault provides an automated, fully managed, cloud-based, data protection service with proactive administration and monitoring of data. The service removes the burden of managing the complex and error-prone data protection process, so you can focus on core projects instead of backup chores.

“Set It and Forget It” Storage Solution

Since 1999, CenterBeam has offered Iron Mountain's LiveVault® Server Backup and Recovery Services to radically simplify the protection of your company's servers including file, database, application and Microsoft® Exchange servers, virtually eliminating the risks and burdens of tape backup.

Fully Automated Backup & Reliable Recovery

With the LiveVault solution, backups are performed automatically and continuously, so data is protected as it is created. The LiveVault solution provides fully automated backup over the Internet or private network connection, for uninterrupted enterprise productivity. Data is moved off-site to secure, mirrored Iron Mountain data centers, without manual IT intervention.

Your Data is Secure Every Step in the Process

At every step — from the moment it leaves your server until it is safely stored in Iron Mountain's remote mirrored data centers — your data is completely secure and protected, using stringent procedures, protocols, and standards. Iron Mountain's LiveVault server backup and recovery solution encrypts all data at the source using 256-bit AES encryption with a unique key that only you have. For an additional layer of protection, the server backup and recovery solution uses the Secure Sockets Layer (SSL) protocol to establish a secure, resilient communication tunnel to the off-site Iron Mountain data centers.

Even recovery is automated. You select the data to recover from a catalog of archived file versions, and LiveVault automatically restores the data to your location. With LiveVault, the time you save on backup and recovery lets you focus on more mission-critical projects for your business.

Rapid Recovery

The LiveVault solution offers advanced technology to make recovery fast and easy.

Unique DeltaStore™ Capability

Instead of restoring an entire file or database after corruption or an inadvertent change, LiveVault restores only the data that has changed. For example, if a virus corrupts a few messages within a large Microsoft Exchange database, LiveVault “rolls back” the database to its exact state at a point before the corruption.

TurboRestore™ Appliance

This simple to install local appliance enables your to quickly recover large amounts of data while meeting the most stringent Recovery Time Objectives (RTO).

Data Shuttle Service

The LiveVault Data Shuttle Service offers initial seeding, large restores, and disaster recovery for multiple terabytes of data quickly. LiveVault Data Shuttle is available on demand by phone, email, or the web portal.

Continuous Backup

The LiveVault solution delivers point-in-time recovery of server data through continuous backup, providing nearly 100 recovery points daily. Continuous backup enables you to choose the exact version of the file to recover from numerous point-in-time versions each day, for vastly improved Recovery Point Objectives (RPO). The LiveVault solution also provides built-in protection of open files and databases, without complex plug-ins or costly third-party tools.

24x7 Monitoring and Management

CenterBeam manages and monitors your entire data protection workflow including backup, off-site storage, archiving, and recovery.
